Keyboard shortcuts A major advantage of AutoCAD is its intelligent and responsive interface. It also has a simple user interface: The user only needs to know a few keyboard shortcuts to perform many common commands. For example, there are so many shortcuts to export and save a drawing that if you do not know what to export or save, you can just press the default key (usually the Enter key) to activate a shortcut. You can also find some more shortcuts on this page.

Common symbols AutoCAD does not use text, instead it uses symbols to represent text. To understand the syntax of symbols, you need to know the names of the symbols. There are two types of symbols: the standard symbol and the nonstandard symbol. The standard symbols are introduced in Chapter 3. The nonstandard symbols are explained in this section.

Standard symbols You can use the standard symbols to perform the most basic commands. These symbols are introduced in Chapter 3. You can use the standard symbols as follows:

- To select a symbol: Press the Enter key to add a new drawing layer or press the Tab key to select a new layer.
- To assign a command to a symbol: Press the Shift key and the Enter key to add a new command.
- To create a break: Press the Enter key.
- To create a bend point: Press the Enter key.
- To select the current layer: Select the layer by pressing the Shift key and the Tab key.
- To remove all or part of a shape: Select the shape by pressing the Shift key and the Enter key.

Nonstandard symbols Nonstandard symbols are used to represent forms, tables, blocks, components, etc. They are introduced in Chapter 4 and Chapter 5. For example, the circle symbol is used to represent a circle, the diamond symbol is used to represent a diamond, and the triangle symbol is used to represent a triangle. You can use nonstandard symbols as follows:

- To select the current symbol: Select the shape by pressing the Shift key and the Tab key.
- To select a property of a symbol: Press the Shift key and the Enter key to select an object that is defined on a different layer. You can also select the object's layer by selecting Layer from the drop-down menu.

Nonstandard symbols are explained in this section.
