In rotary drilling operations, various drilling fluids are used for a variety of purposes. One of the most common is to circulate the drilling fluid into and out of the wellbore to aid in the drilling process. At the surface, the drilling fluid is stored and recirculated during drilling. The drilling fluid is usually a high-viscosity aqueous-based fluid that contains suspended or dispersed solids and additives. The drilling fluid is circulated down to the bottom of the wellbore and up the annulus formed between the drill string and the walls of the wellbore. In reaching the surface, the drilling fluid flows through and out of the wellbore and returns to the surface drilling area in an annular space created between the wellbore wall and the drill string. The drilling fluid may be provided to the wellbore in a c6a93da74d
